[Real or Fake]: Fake Job Description Prediction This dataset contains 18,000 job descriptions, with approximately 800 labeled as fake. It provides both textual data and meta-information related to the jobs, making it ideal for building machine learning models that can classify fraudulent job listings.

Acknowledgments Special thanks to the University of the Aegean's Laboratory of Information & Communication Systems Security for providing this dataset.

Inspiration *This dataset offers numerous possibilities for exploration and analysis, including:*

- Developing a classification model that utilizes both textual and meta-features to predict whether a job description is real or fraudulent.
- Identifying key characteristics (such as words, phrases, or entities) that are common in fake job listings.
- Applying contextual embedding models to discover similarities between job descriptions.
- Conducting Exploratory Data Analysis (EDA) to uncover valuable insights and patterns within the data.
